Patients with wounds, on average, have 3-4 or more chronic conditions.

Nearly 7 million Americans are living with a chronic wound.

Common chronic wounds:
- Diabetic Foot Ulcer (31%)
- Pressure Injuries (43%)
- Venous Stasis Ulcer (12%)
- Surgical Wound/Trauma (8%)
- Arterial Ulcer (6%)

Nearly 25% of people with diabetes will experience a diabetic foot ulcer.

Many factors and conditions that contribute to the development of a chronic wound include diabetes, obesity, heart disease, compromised immune systems, and prolonged periods of immobility.

Pandemic-related delays in care have been associated with a 50% increase in amputations.

Amputation risk is reduced by nearly half when care is provided by a multidisciplinary wound care team.

Advanced wound care treatments include debridement, total contact casting or offloading, new tissue growth, negative pressure wound therapy, and hyperbaric oxygen therapy.

If you are living with a non-healing wound, or caring for someone who is, request an appointment today.
